

Honda Reflex Windscreen Installation/Removal

Time and Ease: Fairly Easy - 30-45 minutes

Tools/Supplies: Phillips screwdriver, windscreen, maybe glue

Step 1- Remove the 2 screws just below the "HONDA" decal on the front cowl (just below the windscreen).

Step 2 - Remove the 2 screws on the pillars that connect the sides of the windscreen to the scooter (1 screw on each pillar, screw heads face driver)

Step 3 - Remove front cowl from the top and remove the rubber trim and cowl at the same time. Be careful not to damage the tabs.

Step 4 - Remove the 6 screws holding the windscreen on. BE CAREFUL! There are grommets and washers that have a tendency to fall into narrow locations if you're not careful. They are retrievable by removing lower body panels if you do though.

Step 5 - For installation of new windscreen, just reverse order. The rubber trim can be temperamental when re-installing. Some people have had to glue it in to get it to stay, but have patience. It fit before you took it off.
